

# Layered Architecture

*Software Architecture*

Richard Thomas

February 23, 2026

Ogres are like onions.

*Orgres have layers*, onions have layers...

You get it? We both have layers.

– *Shrek*

*In the beginning...*

There was the big ball of mud *[Foote and Yoder, 1997]*

Figure: Image from “How to Avoid Spaghetti Code” [Gulsah, 2020].

## *Problem*

Any change can affect any other part of the software.

*“Solution”*

# Modularity

1

## *Problem*

Lack of discipline lets any module communicate with any other module.

2

*Question*

Can you identify an example of layered architecture?

*Question*

Can you identify an example of layered architecture?

*Answer*

Pick any website.

### *Definition 0.* Layer Isolation Principle

Layers should not depend on implementation details of another layer. Layers should only communicate through well defined interfaces (*contracts*).

*Definition 0.* Neighbour Communication Principle

Components can communicate across layers only through directly neighbouring layers.

*Definition 0.* Downward Dependency Principle

Higher-level layers depend on lower layers, but lower-level layers do not depend on higher layers.

### *Definition 0.* Upward Notification Principle

Lower layers communicate with higher layers using general interfaces, callbacks and/or events. Dependencies are minimised by not relying on specific details published in a higher layer's interface.

### *Definition 0.* Sidecar Spanning Principle

A sidecar layer contains interfaces that support complex communication between layers (e.g. design patterns like the observer pattern) or external services (e.g. logging framework).

*Good architectural design...*

Applies these principles to deliver simple,  
modular designs that support modifiability.

Figure: J2EE layered architecture (from *Requirements Analysis and System Design* [Maciaszek, 2007]).

Figure: PCBMER layered architecture with sidecars (adapted from *Requirements Analysis and System Design* [Maciaszek, 2007]).

## PCBMER Layers

**Presentation** Displays bean data, implements UI logic, and updates beans.

# PCBMER Layers

Presentation Displays bean data, implements UI logic, and updates beans.

Controller Implements application specific logic and instantiates beans.

# PCBMER Layers

Presentation Displays bean data, implements UI logic, and updates beans.

Controller Implements application specific logic and instantiates beans.

Bean Data transfer objects used by the Presentation layer.

# PCBMER Layers

**Presentation** Displays bean data, implements UI logic, and updates beans.

**Controller** Implements application specific logic and instantiates beans.

**Bean** Data transfer objects used by the Presentation layer.

**Mediator** Manages business transactions, enforces business rules, instantiates business objects in the Entity layer, and manages the entity memory cache.

# PCBMER Layers

**Presentation** Displays bean data, implements UI logic, and updates beans.

**Controller** Implements application specific logic and instantiates beans.

**Bean** Data transfer objects used by the Presentation layer.

**Mediator** Manages business transactions, enforces business rules, instantiates business objects in the Entity layer, and manages the entity memory cache.

**Entity** Classes representing persistent business objects.
