Specifications Behaviour Driven Development

Definition 1. Infrastructure Code

Code that provisions and manages infrastructure resources.

Definition 2. Infrastructure Code

Code that provisions and manages infrastructure resources.

Definition 3. Infrastructure Resources

Compute resources, networking resources, and storage resources.

```
import boto3
   def create instance():
       ec2_client = boto3.client("ec2", region_name="us-east-1")
       response = ec2.create_security_group(...)
5
       security_group_id = response['GroupId']
       data = ec2.authorize_security_group_ingress(...)
8
       instance = ec2 client.run instances(
10
           SecurityGroups=[security_group_id],
11
           InstanceType="t2.micro",
12
13
           . . .
14
```

```
resource "aws instance" "hextris-server" {
       instance_type = "t2.micro"
2
       security_groups = [aws_security_group.hextris-server.name]
3
       . . .
   resource "aws_security_group" "hextris-server" {
7
       ingress {
8
           from_port = 80
           to_port = 80
10
11
           . . .
12
13
        . . .
```

Question

Notice anything different?

The main difference

Imperative vs. declarative

• Provisions and manages *infrastructure resources*.

- Provisions and manages infrastructure resources.
- Only one part of the movement to automate the complexities of development.

- Provisions and manages infrastructure resources.
- Only one part of the movement to <u>automate</u> the complexities of development.
- Ranges from simple shell scripts up to...?

- Provisions and manages infrastructure resources.
- Only one part of the movement to *automate* the complexities of development.
- Ranges from simple shell scripts up to...?
- Tendancy to be declarative.

Typo?

Infrastructure Code \neq Infrastructure αs Code

Definition 4. Infrastructure as Code

Following the same *good coding practices* to manage Infrastructure Code as standard code.

Warning! Infrastructure as Code still *early* and quite *bad*. Question

What are *good coding practices*?

Good Coding Practice #1

Everything as code

```
#!/bin/bash

./download-dependencies
./build-resources
cp -r output/* artifacts/
```

```
#!/bin/bash

./download-dependencies
./build-resources
cp -r output/* artifacts/

$ cp: directory artifacts does not exist
```

```
resource "aws_instance" "hextris-server" {
   instance_type = "t2.micro"
   security_groups = ["sg-6400"]
   ...
}
```

```
resource "aws instance" "hextris-server" {
       instance_type = "t2.micro"
2
       security_groups = [aws_security_group.hextris-server.name]
3
       . . .
   resource "aws_security_group" "hextris-server" {
7
       ingress {
8
           from_port = 80
           to_port = 80
10
11
           . . .
12
13
        . . .
```

Everything as code avoids

Configuration drift

Configuration drift creates

Snowflakes

1. Reproducible.

Version control

- 1. Restorable.
- 2. Accountable.

Automation

1. Consistent.

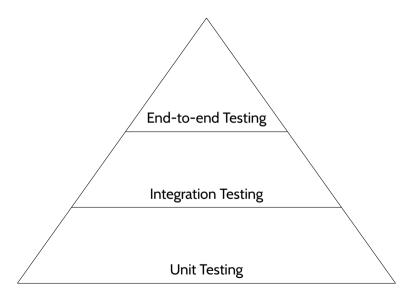

Code Reuse

- 1. Better¹ code.
- 2. Less work.
- 3. Only one place to update (or verify).

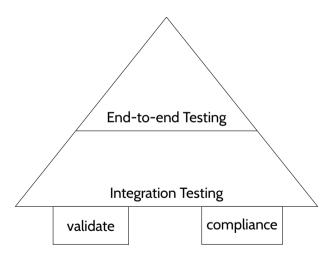

¹generally

Testing

Test Pyramid

IaC Test Pyramid

```
terraformOptions := terraform.WithDefault(t, &terraform.Options{
          TerraformDir: "../week03/",
3
       })
       defer terraform.Destroy(t, terraformOptions)
6
       terraform.InitAndApply(t, terraformOptions)
       publicIp := terraform.Output(t, terraformOptions, "public_ip")
9
       url := fmt.Sprintf("http://%s:8080", publicIp)
10
       http_helper.HttpGetWithCustomValidation(t, url, nil, 200,
12
          func(code, resp) { code == 200 &&
13
                              strings.Contains(resp, "hextris")})
14
15
```

func TestTerraformAwsInstance(t *testing.T) {

Feature: Define AWS Security Groups

When it contains ingress

Scenario: Only selected ports should be publicly open

Given I have AWS Security Group defined

Then it must only have tcp protocol and port 22,443 for 0.0.0.0/0

1. Trust.
