> *Definition 0.* Infrastructure Code
>
> Code that provisions and manages *infrastructure resources*.

Definition 0. Infrastructure Code

Code that provisions and manages *infrastructure resources*.

Definition 0. Infrastructure Resources

Compute resources, networking resources, and storage resources.

Infrastructure Code

Python scripts

Shell scripts | Ansible | Terraform

Shell Scripts

```bash
#!/bin/bash

SG=$(aws ec2 create-security-group ...)

aws ec2 authorize-security-group-ingress --group-id "$SG"

INST=$(aws ec2 run-instances --security-group-ids "$SG" \
          --instance-type t2.micro)
```

Python

```python
import boto3

def create_instance():
    ec2_client = boto3.client("ec2", region_name="us-east-1")
    response = ec2.create_security_group(...)
    security_group_id = response['GroupId']

    data = ec2.authorize_security_group_ingress(...)

    instance = ec2_client.run_instances(
        SecurityGroups=[security_group_id],
        InstanceType="t2.micro",
        ...
    )
```

Terraform

```
1  resource "aws_instance" "hextris-server" {
2      instance_type = "t2.micro"
3      security_groups = [aws_security_group.hextris-server.name]
4      ...
5  }

7  resource "aws_security_group" "hextris-server" {
8      ingress {
9          from_port = 80
10         to_port = 80
11         ...
12     }
13     ...
14 }
```

Question

Notice anything different?

The main difference

Imperative vs. Declarative

Declarative IaC

- Define your *desired* infrastructure state
  - as code

- Engine interprets difference between the *desired* and *actual* state
  - Modifying infrastructure to deliver *desired* state

Infrastructure Code

- Provisions and manages *infrastructure resources*.

Infrastructure Code

- Provisions and manages *infrastructure resources*.
- Only one part of the movement to *automate* the complexities of development.

Infrastructure Code

- Provisions and manages *infrastructure resources*.
- Only one part of the movement to *automate* the complexities of development.
- Ranges from simple shell scripts up to...?

Infrastructure Code

- Provisions and manages *infrastructure resources*.
- Only one part of the movement to *automate* the complexities of development.
- Ranges from simple shell scripts up to...?
- Tendency to be *declarative*.

Typo?

Infrastructure Code ≠ Infrastructure *as* Code

> *Definition 0.* Infrastructure as Code
>
> Following the same *good coding practices* to manage Infrastructure Code as standard code.

Warning!

Infrastructure as Code still *early* and quite *bad*.

What are *good coding practices*?

Good Coding Practice #1
Everything as Code

```bash
#!/bin/bash

./download-dependencies
./build-resources
cp -r output/* artifacts/
```

```bash
#!/bin/bash

./download-dependencies
./build-resources
cp -r output/* artifacts/
```

```
$ cp: directory artifacts does not exist
```

```
resource "aws_instance" "hextris-server" {
    instance_type = "t2.micro"
    security_groups = ["sg-6400"]
    ...
}
```

```
1  resource "aws_instance" "hextris-server" {
2      instance_type = "t2.micro"
3      security_groups = [aws_security_group.hextris-server.name]
4      ...
5  }

7  resource "aws_security_group" "hextris-server" {
8      ingress {
9          from_port = 80
10         to_port = 80
11         ...
12     }
13     ...
14 }
```

Everything as code avoids

Configuration drift

Configuration drift creates

Snowflakes

Benefits

1. Reproducible

Good Coding Practice #2

Version Control

Benefits

1. Restorable
2. Accountable

Good Coding Practice #3

Automation

Benefits
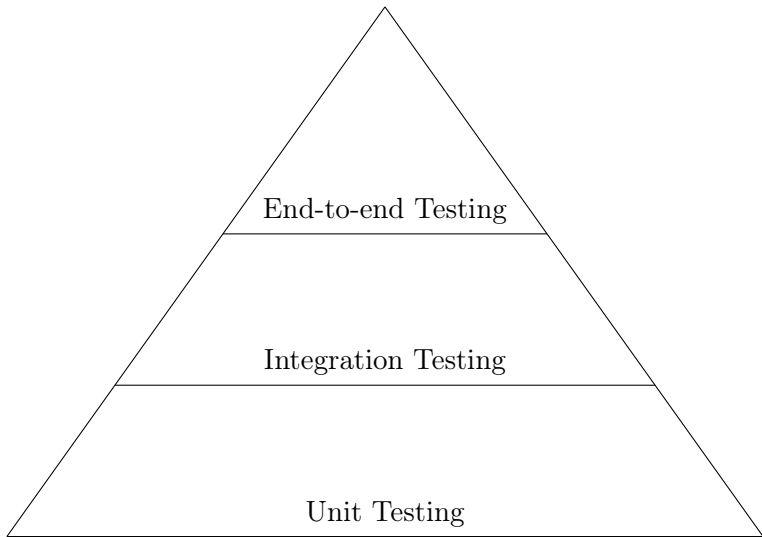

1. Consistent

Good Coding Practice #4

Code Reuse

Benefits

1. Better[1] code
2. Less work
3. Only one place to update (or verify)

---

[1]generally

Good Coding Practice #5

Testing

Test Pyramid

End-to-end Testing

Integration Testing

Unit Testing

IaC Test Pyramid

```go
func TestTerraformAwsInstance(t *testing.T) {
    terraformOptions := terraform.WithDefault(t, &terraform.Options{
        TerraformDir: "../week03/",
    })

    defer terraform.Destroy(t, terraformOptions)
    terraform.InitAndApply(t, terraformOptions)

    publicIp := terraform.Output(t, terraformOptions, "public_ip")
    url := fmt.Sprintf("http://%s:8080", publicIp)

    http_helper.HttpGetWithCustomValidation(t, url, nil, 200,
        func(code, resp) { code == 200 &&
                            strings.Contains(resp, "hextris")})
}
```

```gherkin
1  Feature: Define AWS Security Groups

3  Scenario: Only selected ports should be publicly open
4      Given I have AWS Security Group defined
5      When it contains ingress
6      Then it must only have tcp protocol and port 22,443 for 0.0.0.0/0
```

Benefits

1. Trust
