Deployment Strategies

CSSE6400

Richard Thomas

May 6, 2024

Definition 1. Deployment Strategy

How a software system is made available to clients.

Deployment Strategies

- Branching Strategies
- Recreate Deployment
- Rolling Deployment
- Blue/Green Deployment
- Canary Deployment
- A/B Deployment
- Shadow Deployment

Definition 2. Branching

Copying the trunk to allow separate and parallel development.

Branching Strategies

- GitHub Flow

- GitLab Flow

- Release Branches

GitHub Flow[Haddad, 2022]

- Main is always deployable
- Create branch
- Make changes
- Create pull request
- Resolve issues
- Merge pull request
- Delete branch

GitLab Flow [Saavedra, 2023]

- Supports deployment windows
  - Merge to production
  - Deploy when allowed
- Production branch
  - Plus alpha, beta, …
- Still have
  - Feature branches
  - Pull requests

MASTER   **PRODUCTION**
DEPLOY

Release Branches[Saavedra, 2023]

- Supports multiple versions of system
- Feature development in main
- Released versions are branches
- Bug fixes in main
  - Cherry-pick into branches
Recreate Deployment [Tremel, 2017]

Recreate Deployment

Pros

- Easy
- Renewed state
  - App reinitialised
  - Persistent storage consistent with system version

Cons

- Downtime

Rolling Deployment [Tremel, 2017]

V1

V2

LB

Pros

- Fairly easy
- Slow release of new version
  - Observe issues
  - Rollback
- Stateful instances can finish gracefully
  - Instance is killed when inactive

Cons

- Time
- Support multiple APIs
- Support different versions of persistent data structure
- No control over traffic to different versions

Blue-Green Deployment [Tremel, 2017]

Blue-Green Deployment

Pros

- Instant release of new version
- Fast rollback if necessary
- Only one version 'live' at any time
  - No versioning conflicts

Cons

- Expensive
  - Double the infrastructure
- Stateful instance version switch difficult
  - Can't kill instance in middle of a transaction

Canary Deployment [Tremel, 2017]

V1 · **LB** · **V2** · 90% · 10%

Canary Deployment

Pros

- New version released to subset of users
- Can monitor performance and error rates
- Easy and fast rollback

Cons

- Slow
- Implies poor testing

A/B Deployment[Tremel, 2017]

A/B Deployment

Pros

- Multiple versions run in parallel

- Full control over traffic distribution

Cons

- Needs intelligent load balancer

- Debugging a version is difficult
  - Need good logs & tools

Shadow Deployment[Tremel, 2017]

V1

LB

V2

Shadow Deployment

Pros
- Performance testing with production traffic
- No impact on users

Cons
- Expensive
  - Double the infrastructure
- Complex to setup
  - Need mocks for external services

Deployment Strategy Options

- Staging or beta testing
  - Recreate or Rolling
- Production (Live)
  - Rolling or Blue/Green
- Uncertain of system stability
  - Canary
- Evaluation
  - A/B or Shadow

Deployment Considerations [Tremel, 2017]

Strategy	ZERO DOWNTIME	REAL TRAFFIC TESTING	TARGETED USERS	CLOUD COST	ROLLBACK DURATION	NEGATIVE IMPACT ON USER	COMPLEXITY OF SETUP
RECREATE — version A is terminated then version B is rolled out	✗	✗	✗	■□□	■■■	■■■	□□□
RAMPED — version B is slowly rolled out and replacing version A	✓	✗	✗	■□□	■■■	■□□	■□□
BLUE/GREEN — version B is released alongside version A, then the traffic is switched to version B	✓	✗	✗	■■■	□□□	■■□	■■□
CANARY — version B is released to a subset of users, then proceed to a full rollout	✓	✓	✗	■□□	■□□	■□□	■■□
A/B TESTING — version B is released to a subset of users under specific condition	✓	✓	✓	■□□	■□□	■□□	■■■
SHADOW — version B receives real world traffic alongside version A and doesn't impact the response	✓	✓	✗	■■■	□□□	□□□	■■■
